

Ideation Phase

Empathize & Discover

Date	29-06-2026
Project Name	Automated Network Request Management
Team ID	
Maximum Marks	

Empathy Map:

Persona 1: The End-User (e.g., Frontend Developer)

Says & Thinks

Says:

- “I just need port 443 open for my API—why does this take multiple days and follow-ups?”
- “I’m not sure which form to select or what network details are required.”

Thinks:

- “The network team feels like a black box—I don’t know what’s happening after I submit a request.”
- “This slow process might delay my deployment deadline.”

Sees

- A complex and fragmented ticketing system with unclear request categories.
- Lack of real-time updates on ticket status unless manually followed up.
- Project delays caused by infrastructure request bottlenecks.

Hears

- From Management: “Why isn’t the application live yet? We need to meet the release deadline.”
- From Peers: “Submit it early—network requests always take time.”

Persona 2: The Fulfiller (e.g., Network Administrator)

Says & Thinks

- “Many tickets are missing critical details like source IP, destination, or justification.”
- “I spend too much time manually configuring firewall rules instead of improving systems.”

Thinks:

- “A small manual error could cause a major network outage.”
- “Audit preparation is difficult because records are scattered across emails and chats.”

Sees

- A growing backlog of repetitive and routine network requests.
- Poor-quality submissions from emails, chats, and incomplete forms.
- Outdated CMDB entries requiring manual updates after every change.

Hears

- From Users: “Please escalate this—it's urgent.”
- From Auditors: “Where is the approval trail and validation for this firewall change?”

Pain & Gain Analysis

Sees

- An endless queue of routine, repetitive tickets piling up daily.
- Incomplete request forms submitted through loose chat messages, emails, and generic tickets.

- An outdated or disconnected CMDB that requires manual updates after every configuration change.

Hears

- **From Users:** *"Can you please escalate this ticket? It's urgent!"*
- **From Auditors:** *"Where is the authorized manager approval signature and validation log for this specific firewall change?"*

Pain & Gain Analysis

Category	Details
Pain (Challenges & Frustrations)	End-User: Lack of visibility, unclear request process, repeated delays impacting deployment timelines. Fulfiller: High workload of repetitive tasks, incomplete or incorrect requests, risk of human error, and difficult audit tracking
Gain (Desired Outcomes & Success Measures)	End-User: Simple self-service request portal, faster approvals for low-risk changes, real-time status tracking, and faster delivery. Fulfiller: Automated request validation, API-driven network configuration, reduced manual effort, and fully audit-ready, centralized tracking systems.
