Journey Map: Network Access Request

Scenario: A Security Operations (SecOps) alert detects suspicious lateral movement from a compromised server. The Network Administrator must quickly isolate the asset by disabling its firewall access through ServiceNow's automated emergency pipeline.

Journey Phase	User Actions & Goals	Experience & Opportunities
1. Detect (Awareness)	Action: Receives a high-priority security alert indicating malicious traffic from a specific server IP. Touchpoints: SIEM dashboard, PagerDuty/SMS alerts. Goal: <i>"I need to contain this threat immediately before it spreads further."</i>	[+] Immediate alert visibility improves response time. [-] High stress due to active incident severity. Opportunity: Auto-create a pre-filled ServiceNow emergency isolation ticket directly from SIEM alerts.

2. Access <i>(Initiation)</i>	Action: Logs into ServiceNow and navigates to the dedicated Emergency Network Isolation Workspace. Touchpoints: ServiceNow admin portal, emergency dashboard. Goal: <i>"I need a fast-track process without normal approval delays."</i>	[+] Emergency workflows are clearly separated from standard requests. [-] Too many validation steps may slow urgent action. Opportunity: Add a one-click "Quarantine Asset" option on the main dashboard.
3. Execute <i>(Core Process)</i>	Action: Selects the infected asset from CMDB, chooses Full Network Isolation, and submits an emergency justification token. Touchpoints: Smart intake form, CMDB asset selector, security override module. Goal: <i>"I need to isolate the correct asset quickly and safely."</i>	[+] Auto-validation prevents incorrect configurations. [-] Manual input errors can still cause wrong isolation. Opportunity: Replace manual IP entry with CMDB-driven asset selection for accuracy.

4. Verify <i>(Execution)</i>	Action: ServiceNow Integration Hub triggers API calls to firewalls, blocking all inbound and outbound traffic for the compromised asset. Touchpoints: Live execution logs, progress tracker. Goal: <i>"I need instant confirmation that the asset is fully isolated."</i>	[+] Automated execution reduces action time from hours to seconds. [-] API failures or delays could increase risk exposure. Opportunity: Add automated connectivity tests to confirm the isolation instantly
5. Review <i>(Post-Incident)</i>	Action: Reviews audit logs, API execution history, and updated CMDB records for compliance. Touchpoints: Incident report, SecOps audit dashboard. Goal: <i>"I need complete auditability for compliance and future analysis."</i>	[+] Immutable logs simplify compliance and forensic review. [-] Risk of forgetting to restore access after remediation. Opportunity: Automatically create a follow-up review ticket after 48 hours for restoration assessment.
