Problem - Solution Fit Canvas

1. CUSTOMER SEGMENTS

- **End Users (Employees):** Employees who require network access such as VPN setup, firewall port openings, or secure connectivity to complete their work.
IT Network Fulfillers: Network engineers and IT support teams who require clean, validated, and structured request data for efficient fulfillment.

2. JOBS-TO-BE-DONE / PROBLEMS

- Submit network service requests without needing technical networking knowledge or jargon.
- Obtain fast approvals for restricted or sensitive network access.
- Track the real-time status of submitted requests without manual follow-ups.

3. TRIGGERS

- Employee assigned to a new project requiring access to restricted network resources.
- New employee onboarding requiring VPN and standard network access setup.
- Urgent deadlines where lack of connectivity blocks productivity or delivery.

4. EMOTIONS BEFORE / AFTER

- **Before:** Frustrated, blocked, anxious, and under pressure due to delayed IT responses and restricted access.
- **After:** Confident, relieved, productive, and reassured by fast and transparent IT support.

5. AVAILABLE SOLUTIONS

- Sending manual, unstructured emails to the IT Helpdesk.
- Walking physically to the IT department to ask for access.
- Using outdated, cluttered legacy ticketing systems that ask irrelevant questions.

6. CUSTOMER CONSTRAINTS

- **Limited Technical Knowledge:** Users may not know details such as MAC addresses, subnets, or network configurations.
- **Time Constraints:** Users cannot afford delays or manual back-and-forth with managers for approvals.

7. BEHAVIOUR

- Users submit incomplete tickets because they do not understand the forms.
- Users frequently ping IT staff on chat to ask, "What is the status of my request?"
- Users complain to their department heads about IT being a bottleneck.

8. CHANNELS of BEHAVIOUR

- **Digital Channels:** Microsoft Teams, Slack, Email (Outlook), and internal intranet portals.
- **Offline Channels:** Physical IT service desks, face-to-face requests, and phone-based helpdesk calls.

9. PROBLEM ROOT CAUSE

- Lack of automated workflow routing; requests sit in inboxes waiting for manual manager approval.
- Forms are static and not dynamic, leading to user confusion and poor data quality.
- Zero visibility or automated communication regarding request status.

10. PROPOSED SOLUTION

- A **ServiceNow-based self-service portal** featuring an intuitive, dynamic Network Request catalog.
- Automated multi-tier approval workflows that intelligently route requests to the correct approvers.
- Real-time notifications (email/Teams/Slack) at key stages such as submission, approval, and completion to eliminate manual follow-ups and status chasing.
